## Summary of index laws

 $x^m \times x^n = x^{m+n}$  When multiplying terms, add the indices.

 $x^m \div x^n = x^{m-n}$  When dividing, subtract the indices.

 $(x^m)^n = x^{mn}$  When finding the power of a power, multiply the indices.

 $x^0 = 1$  Any value to the power 0 is equal to 1

 $x^{-m} = \frac{1}{x^m} \qquad \text{(when } x \neq 0\text{)}.$ 

$$\sqrt{x} \times \sqrt{x} = x$$

So, 
$$x^{\frac{1}{2}} = \sqrt{x}$$

$$\sqrt[3]{y} \times \sqrt[3]{y} \times \sqrt[3]{y} = y$$

So 
$$y^{\frac{1}{3}} = \sqrt[3]{y}$$

So, 
$$x^{\frac{1}{m}} = \sqrt[m]{x}$$
.

In general terms:  $x^{\frac{m}{n}} = x^{m \times \frac{1}{n}} = (x^{\frac{1}{n}})^m = (\sqrt[n]{x})^m$ 

$$x^{\frac{2}{3}} = (x^{\frac{1}{3}})^2$$
  $\frac{1}{3} \times 2 \text{ is } \frac{2}{3}$ 

$$y^{\frac{3}{4}} = (y^{\frac{1}{4}})^3$$
  $\frac{1}{4} \times 3 = \frac{3}{4}$ 

$$(x^{\frac{1}{3}})^2 = (\sqrt[3]{x})^2$$
 and  $(y^{\frac{1}{4}})^3 = (\sqrt[4]{y})^3$ 

So, 
$$(x^{\frac{2}{3}}) = (\sqrt[3]{x})^2$$
 and  $(y^{\frac{3}{4}}) = (\sqrt[4]{y})^3$ .

#### **Example**

If  $2^x = 128$  find the value of x.

 $2^x = 128$  Remember this means  $2 = \sqrt[x]{128}$ .

 $2^7 = 128$  Find the value of x by trial and improvement.

 $\therefore x = 7$
